技术规格

Background:	The protein encoded by this gene is a retinoid-inducible nuclear protein containing a CXXC-type zinc finger motif. The encoded protein is involved in myelopoiesis, is required for DNA damage-induced p53 activation, regulates the differentiation of C2C12 myoblasts into myocytes, and negatively regulates cutaneous wound healing. Several transcript variants encoding the same protein have been found for this gene.
Applications:	ELISA, WB, IHC
Name of antibody:	CXXC5
Immunogen:	Fusion protein of human CXXC5
